

AAM TECHNOLOGIES

When quality matters...

AAM Technologies Ltd.

Started as a brains trust for application integration and custom software development, today our expertise ranges from integrating mission critical business systems to performing enterprise architecture management, delivering IT service management solutions and building corporate applications. As a principle, we focus on solving individual business problems, while always keeping an eye on the global picture.

Our solutions are based on the best technologies and industry standards to deliver tangible business results. AAM Technologies is a certified business partner of leading vendors and technology providers like Oracle, IBM, Microsoft, SUN, Garderos, IDI Technology Solutions and Reuters. Our experts and programmers are highly qualified and certified engineers.

Most of our projects are implemented in the finance sector, which requires our solutions to represent the greatest security, scalability and the most reliable and efficient operation. However, the exceptional quality of our work and products is also successfully delivered to other sectors such as pharmaceuticals, telecommunications, energy and government.

Focus areas

Enterprise Architecture Management

We'll help you discover your current architectural state (AS-IS) by building your Enterprise Repository with SAMU, our award winning Enterprise Architecture Management tool. Next, we'll assist you with the definition of your desired future state, which is aligned with your strategic goals (TO-BE). Having accomplished the first two, a gap analysis can then be performed to show the way to go. AAM can help you along all these phases. One of the best outcomes you'll achieve is that you can start planning your investments along with strategic and operative decisions with relevance to business and IT using straight-to-the-point graphical maps of your Enterprise.

Treasury Business Automation

The Treasury Backbone solution of AAM Technologies was developed to help Treasury departments with critical daily operations such as obtaining online FX and interest rates and equity prices from data providers like Reuters, performing a centralized automatic calculation of all generated rates, transforming price and static information to fit in the back-end systems, ensuring that approvals are made in an auditable manner and finally, distributing them on secure channels like Message Queues.

IT Service Management

How could you utilize your IT resources better to serve business strategy if your IT services are not planned and changes to them are not maintained carefully? Hand in hand with Enterprise Architecture initiatives, this challenge can be handled with our tool, SAMU. You can achieve end-to-end change management integrated into your HelpDesk, with business continuity and disaster recovery planning, while maintaining an always auditable repository of your Enterprise.

Core services

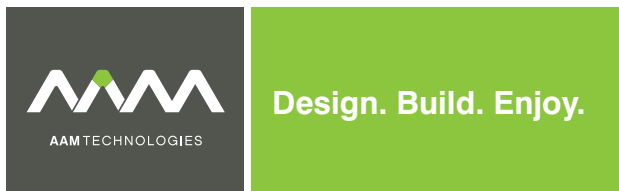

- **Custom Application Development:**

None of the enterprises are the same; none of the circumstances are identical. We started as solution providers responding to custom business challenges. We're still delivering tailor-made solutions to our clients, like CRM and Sales Support Systems, Anti-money Laundering Systems, Credit Card Issue Workflows and so on. All of these are based on industry standards and reliable technologies such as IBM, Oracle, Microsoft and Sun.

- **Business Application Integration:**

In the majority of the cases, companies have developed highly complex IT and business environments over the years. Managing complexity well can simplify operations and improve your business offerings to customers and partners. Thus, it can directly contribute to generating a competitive edge. Our core competency is business application integration, based on industry standards and reliable technologies like IBM WebSphere, Oracle BEA, Sun eGate and Misys.

With the consulting capabilities of AAM Consulting and the power of AAM Technologies to deliver solutions, we are able to handle projects of the highest complexity from capturing the business problem to completion.
